## Proportionality Wrap-UP

In the linear proportionality model, $\mathrm{y}=\mathrm{mx}$ we say in words y is proportional to x In the squared proportionality model, $y=m^{2}$ we say in words $y$ is proportional to $x^{2}$ In the inverse proportionality model, $y=m(1 / X)$ we say in words $y$ is proportional to $1 / x$

| MODEL | When X is | Then $\mathbf{Y}$ is |
| :---: | :---: | :---: |
| $\mathrm{Y}=\mathrm{mx}$ | doubled |  |
| $\mathrm{Y}=\mathrm{mx}$ | tripled |  |
| $\mathrm{Y}=\mathrm{mx}^{2}$ | doubled |  |
| $\mathrm{Y}=m x^{2}$ | tripled |  |
| $\mathrm{Y}=\mathrm{m}(1 / \mathrm{x})$ | doubled |  |
|  |  |  |
| $\mathrm{Y}=\mathrm{m}(1 / \mathrm{x})$ | tripled |  |
|  |  |  |

Doubled means when $x$ changes from 1 to 2 or from 5 to 10 or from 40 to 80 or from ...
Tripled means when x changes from 1 to 3 or from 5 to 15 or from 40 to 120 or from ...
